ON UTILIZING DEPENDENCE-TREE MODELING IN ARBITRARY SIMULATIONS

**B. http://www.dacya.ucm.es/jlrisco/SCSC10/doku.php?id=on_utilizing_dependence-tree_modeling_in_arbitrary_simulations John Oommen, Chancellor's Professor
Fellow of IEEE and IAPR, School of Computer Science
Carleton University, Canada**

The art and science of simulation involves modeling the various possible events that could occur using *random* vectors. Further, in every study involving random vectors, the question of determining the dependence between the variables (in these vectors) is fundamental to the simulation and to the associated data processing techniques. In the simplest model, the variables can be viewed from a simplistic perspective, and assumed to be independent. At the other extreme of the spectrum, one can assume that every variable is dependent on every other variable. The situation then becomes both extremely complex and intractable unless one resorts to Markovian-like assumptions. In this paper, we shall show how one can model the dependence using a linear number of dependencies implying the so-called *Dependence Tree*. We shall discuss the various scenarios encountered when the metrics for measuring the quality of the approximation is entropy-based or *Chi-square* based. In each case, we shall show how one can simulate events based on such a random vector, and also how the parameters associated with this random vector can be learned. Experimental results demonstrating the power of this modeling strategy will also be included in the paper.

Dr. John Oommen was born in Coonoor, India on September 9, 1953. He obtained his B.Tech. degree from the Indian Institute of Technology, Madras, India in 1975. He obtained his M.E. from the Indian Institute of Science in Bangalore, India in 1977. He then went on for his M.S. and Ph. D. which he obtained from Purdue University, in West Lafayette, Indiana in 1979 and 1982 respectively. He joined the School of Computer Science at Carleton University in Ottawa, Canada, in the 1981-82 academic year. He is

still at Carleton and holds the rank of a Full Professor. Since July 2006, he has been awarded the honorary rank of *Chancellor's Professor*, which is a lifetime award from Carleton University. His research interests include Automata Learning, Adaptive Data Structures, Statistical and Syntactic Pattern Recognition, Stochastic Algorithms and Partitioning Algorithms. He is the author of more than 330 refereed book chapters, journal and conference publications, and is a *Fellow of the IEEE* and a *Fellow of the IAPR*. Dr. Oommen has also served on the Editorial Board of the *IEEE Transactions on Systems, Man and Cybernetics*, and *Pattern Recognition*.

**BUT WHAT IF IT GETS WORSE?
REALLY GRAND CHALLENGES FOR MODELING AND SIMULATION IN A RISKY
AND COMPLEX WORLD**

Priscilla Elfrey, Kennedy Space Center, NASA

The headlines scream about one disaster after another where few seem to have given adequate thought or effort to unanticipated consequences. Whether finance, evil intent or natural events—modeling and simulation can and should play a part in innovative and effective solutions. It is not enough to have a good plan or even adequate execution. We need to ask hard questions and apply extraordinary skills to our decision making and action. As a community, we need to create opportunities to apply our imagination, technology, rigorous effort and, systematic attention to risk whether long-term or immediate. Apollo 13, 9/11, the financial crisis, the oil spill in the Gulf of Mexico and tomorrow's headlines remind us of the need for uncommon common sense as do our everyday opportunities to change the world.

Priscilla Elfrey chairs the GC/MS:ICCRE. At the Kennedy Space Center, she supports simulation for space exploration, especially lifecycle innovation, outreach, international research opportunities and work to establish the Human-Centered Design and Learning Institute. She is leading the NASA STEM PLACE at I/ITSEC and represents KSC on SimSummit. She managed training at NYU and Yale, was a founder of 2 off-off Broadway theaters, founder and project manager of what is now the National Center for Simulation, produced award winning videos for NASA and wrote *The Hidden Agenda* published by John Wiley and numerous conference papers and articles on technology, careers, storytelling and the arts. Educated in NYC (Barnard, Columbia, Moreno Institute and Cornell) and the first woman Associate Dean of Yale College and former Fellow of Calhoun College- and Florida Atlantic University Center for Electronic Communication, she is SCS liaison on the SISO Conference Committee, director of Liophant and a Fellow of the MISS, Savona, Italy

UDMTEK

UDMTEK was established in 2007 from UDM (unified digital manufacturing) laboratory at the division of industrial & information systems engineering, Ajou university. The company focused on research & development of next generation simulation areas. PLC Studio ® was developed for validating a control program of machine or manufacturing systems under virtual environment. It showed excellence in changing U.S. Alabama shuttle & AS/RS line of Hyundai motor company in 2008. At that time, U.S. Alabama factory was built by foreign engineer, which all control logics were developed by German engineers. According to change of production line, it was really difficult to change all control programs, which were developed by others. Using virtual factory,

established by PLC Studio ® , Hyundai control engineers could start to test all control programs at design phase, improve them, make them robust, and also commission all machines virtually prior to real operation.

Starting from 2008, PLC Studio ® had been applied for virtual commissioning under abnormal conditions of semiconductor & LCD machines. Without using a real machine or manufacturing line, virtual commissioning could reduce cost and risk since expensive materials and energy could be consumed by real operation test. One of important issues is to validate a control logics under possible abnormal conditions, which might be dangerous or very expensive to prepare an abnormal test environment and to commission it.

Currently using **PLC Studio** ® , **UDMTEK** tries to develop an efficient training, monitoring, maintenance operation test, and marketing tool by allowing peoples to provide a necessary domain knowledge of a machine or manufacturing systems such as operation control of semiconductor/LCD machine, steel equipment line, chemical equipment systems, automotive line, nuclear plant, and all other PLC controlled systems.

The Society for Modeling & Simulation International (SCS) was established in 1952 as a nonprofit, volunteer-driven corporation called Simulation Councils, Inc. Simulation Councils, Inc. became The Society for Computer Simulation which is where we derived the acronym SCS. Today, we still keep the familiar SCS acronym as a part of our identity, but have given it a new and more relevant meaning: Simulate, Create, Serve. This SCS is not only who we are, but also who we serve.

SCS is the only technical Society dedicated to advancing the use of modeling & simulation to solve real-world problems. SCS is the principal technical society devoted to the advancement of simulation and allied computer arts in all fields. The purpose of SCS is to facilitate communication among professionals in the field of simulation. To this end, SCS organizes meetings, sponsors and co-sponsors national and international conferences, and publishes the *SIMULATION: Transactions of The Society for Modeling and Simulation International* and the *Journal of Defense Modeling and Simulation* magazines.
